

Description				
The register page shouldn't allow different passwords to be passed to Confirm password. So it should display a proper error message to users. And Should send invalid data to the back end. But there is a defect in both layers FE and BE. Because The FE side should not allow posting the registration with data that includes different repeated passwords from the password. Even if the FE allows the posting of data that includes the invalid the confirm password the back-end should return a proper error message to FE and should break the registration process.				
Date	Author	Page	OS	Browser
21.12.2022	Serhat	https://parabank.parasoft.com/parabank/register.htm	macOS Monterey 12.6	Chrome Version 108.0.5359.124
Precondition	Test Data	Step	Expected Result	Actual Result
All form field should fill out with valid data expect Password and Confrim	Password: pass123 Confirm: pass124	Type Password and Confrim then click on the Register button	The page should display a proper error message as "Passwords did not match."	Registration complate successfuly
